

Build a useful computer operator

We are building software that receives a company goal, operates applications on a computer, and finishes the work with evidence. Build a small working prototype of this idea that accepts a plain-English goal and completes a meaningful business task.

Choose the challenge

You choose the workflow, applications, data, technology and design. Pick something useful and technically challenging that involves multiple steps. Use browser or desktop interaction as part of the task, alongside files or another application. Work in a test environment you control.

What we want to see

Working execution. The operator performs the task and produces a usable result. Show the actual application interactions.

Adaptability. Demonstrate a variation in the goal or input without changing the code.

Recovery. Introduce a meaningful failure or interruption. Show how the operator recovers, or explains a concrete blocker, while avoiding duplicated or unintended actions.

Verified completion. Check the resulting application state or artifacts and show evidence that the goal was met. Make incomplete work visible.

Human control. Show progress, allow the user to pause, and seek approval when an action exceeds the authority they gave.

What to submit

Source and setup instructions so we can run it.

A short demo video (up to 5 minutes) showing the task, a variation and the failure case.

A brief engineering note explaining your choices, personal contribution, tools/AI assistance, limitations and what you would build next.

Choose any stack and reuse libraries or your own work. Disclose assistance and be ready to explain and modify the code. Use synthetic data; keep credentials out of the submission. State any model or account requirements.

How we will assess it

We will look at usefulness and ambition, execution quality, reliability, engineering judgment, and how well you understand and own what you built.

Submission window: 5 calendar days after the invitation. Aim for 8-12 focused hours, stop after 12, and explain unfinished parts. Submit using the instructions and deadline in your invitation.
